## Do U.S. Anglers Care about Harmful Algal Blooms? A Discrete Choice Experiment of Lake Erie Recreational Anglers

Wendong Zhang  Brent Sohngen

First published: 23 March 2018 | <https://doi.org/10.1093/ajae/aay006> | Citations: 23

### Abstract

Despite the growing awareness of harmful algal blooms (HABs) in the United States and abroad, estimates of welfare losses due to their presence are missing from the literature. Using a mail survey of 767 Ohio Lake Erie recreational angler respondents and a choice experiment, this study provides the first empirical quantification of the economic impacts of HABs on U.S. recreational anglers. Our results demonstrate a significant and substantial willingness to pay by anglers for reduction in HABs, beyond the benefits associated with conventional water quality measures such as catch rates and water clarity. For instance, we find that anglers are willing to pay \$8 to \$10 more per trip for one less mile of boating through HABs en route to a fishing site. This finding suggests that explicit measures of HABs need to be collected and considered when valuing water quality in nutrient-rich bodies of water. We evaluate the welfare improvements resulting from several nutrient reduction policies, and find that anglers are willing to pay on average \$40 to \$60 per trip for a policy that cuts upstream phosphorus loadings by 40%. The majority of welfare gains for anglers result from improving the non-catchable component of the fishing experience, notably water clarity and HAB reduction, as opposed to better chances of angler success.

## Improving the Effectiveness of Conservation Programs through Innovative Reverse Auctions and Sensible Enrollment Restrictions

Date: Sep 2017

Investigators: Wendong Zhang, Gregory Howard

### Cleaner Water Begins with You!

Edge-of-field Conservation Practices Benefit Water Quality and Wildlife

### Cleaner Water Begins with You!

Edge-of-field Conservation Practices Improve Water Quality

**↓52%**

Water quality enhancement wetlands decrease nitrogen going into surface water by an average of 52 percent, depending on the size of the wetland.

Numerous species of birds, insects, mammals, reptiles, and amphibians—including **species of greatest conservation need**—rely on wetlands as valuable habitat.

**Edge-of-field practices could work for you and for the watershed!**

No one practice is ideal for all sites, so talk to your local conservation or Extension team—they can point you to science-based tools that will help with your decision. You'll be helping to strengthen the overall health of your watershed and improving water quality in Iowa and beyond.

**↓52%**

Water quality enhancement wetlands decrease nitrogen going into surface water by an average of 52 percent, depending on the size of the wetland.

Restored oxbows decrease nitrogen entering surface water by an average of 56 percent.

Wetlands, especially oxbows, also provide additional water storage on the landscape.

### Abstract

Farmland has long represented a significant component of both farm sector and farm household assets. This chapter provides a comprehensive overview of significant developments in modeling farmland values, with attention to methodological challenges and recent modeling innovations. After outlining the capitalization model that provides the theoretical underpinnings for most farmland value studies, the merits and efficacy of dynamic models using aggregate data, as well as increasingly popular cross-sectional hedonic models that use spatially disaggregate data are presented. Estimation issues in hedonic models are reviewed, with a focus on those deserving special consideration in the context of farmland values such as spatial dependence and heterogeneity and sample selection bias. Promising future research directions include greater use of nonparametric approaches, quasi-experimental designs, panel data analyses, and structural econometric models, which take advantage of spatially explicit farmland values data but avoid the restrictive assumptions of standard spatial lag and spatial error models.

## Housing Market Bust and Farmland Values: Identifying the Changing Influence of Proximity to Urban Centers

Wendong Zhang, and Cynthia J. Nickerson

### Abstract

This article estimates the impact of the 2007–2008 residential housing market bust on farmland values, using parcel-level farmland sales data from 2001–2010 for a 50-county region under urbanization pressure in western Ohio. Hedonic model estimates reveal that farmland was not immune to the residential housing bust; the portion of farmland value attributable to proximity to urban areas was almost cut in half shortly after the bust in 2009–2010. Nonetheless, total farmland prices remained relatively stable in the 2000s, likely due to increased demand for agricultural commodities. Our results are robust to different assumptions about the structure of the unobserved spatial correlation. (*JEL Q15, R14*)

### Are You a Student Looking for an Internship?

The Pathways Program is designed to provide the student with the knowledge, skills, and/or abilities while being employed in the Federal government. The Pathways Program consists of three categories: internship, recent graduate, and the [Presidential Fellows Management programs](#). Each program is unique and they all provide development experience in conjunction with former education. The student can determine which program best suits their interest and/or skills and abilities.

In the Internship Program, ERS hires students for summer internship positions during the summer. The summer internship program provides paid opportunities for the student to work full-time or half-time until September 30<sup>th</sup>. A student must be enrolled full-time or half-time at an accredited school (high school, technical or vocational school, 2 or 4 year college, university, graduate, or professional school) and is in good academic standing (2.0 GPA or better). All student positions are advertised via [usajobs.gov](#). The student must submit all required documents via [usajobs.gov](#).

[+](#) Author Affiliations

#### Abstract

Opinion surveys are the dominant method for gauging U.S. farmland values. However, there is no systematic evaluation of how opinions are formulated and change over time. Using panel data of agricultural professionals from the Iowa Land Value Survey over 2005–2015, we investigate how surveyed experts update their farmland value estimates. We find that experts almost fully correct their prior “errors” in a single period. Experts’ opinions also incorporate most of the prevailing price innovations in one period. Our Bayesian estimation technique simultaneously addresses the unobservability and nonstationarity of prevailing farmland values and the Nickell bias in short dynamic panels.

# What drives landowners' conservation decisions? Evidence from Iowa

W.P.M. Sawadgo, W. Zhang, and A. Plastina

**Abstract:** Conservation practices such as no-till and cover crops have been shown to have on- and off-farm benefits. However, when benefits of a practice do not go to the provider, underinvestment may occur. Farmland rental arrangements where tenants may not reap the benefits of conservation investments are a commonly cited barrier to conservation practice adoption in agriculture and may result in lower adoption rates on rented land than on owner-operated fields. This issue is especially important since more than half of Midwestern farmland is rented out. This article examines the factors driving adoption of four key conservation practices—no-till, cover crops, buffer strips, and ponds/sediment basins—using a statistically representative survey of Iowa landowners. We find evidence supporting the hypothesis that adoption is lower on rented land for cover crops, buffer strips, and sediment basins, but not for no-till. Our results also show that the large proportion of the state's land owned by nonoperating landowners and absentee landowners could present a barrier to increasing adoption of conservation practices. Furthermore, landowners seem open to increasing the use of cover crops in the immediate future, and a sizable number are even willing to incentivize tenants by paying for part of the cover crop planting cost. Finally, almost half of landowners would be willing to increase the area of their land under conservation practices if they could receive conservation-related tax credits or deductions, suggesting a potential policy strategy to increase adoption.

**Key words:** absentee landowners—conservation practice—cover crops—land tenure—non-operating landowners—no-till

### Abstract

The current trade war between the United States and China is unprecedented in modern history. This study introduces a database of tariff increases resulting from the trade war and quantifies the impacts using the canonical GTAPinGAMS model calibrated to the recently released GTAP version 10 accounts. We find that the remaining tariff increases as of March 2020 after the phase one trade deal decrease welfare in China by 1.7% and welfare in the United States by 0.2%. Impacts on sectoral revenue are reported for both countries. China's exports to and imports from the United States are reduced by 52.3% and 49.3%. The trade flow between the United States and China will be diverted to their major trade partners resulting in higher welfare in those countries, including many Asian countries. The estimated impacts are robust to using alternative trade elasticities and are amplified in the absence of the phase one tariff reductions.

### Abstract

We calibrate the Center for Agricultural and Rural Development International Agricultural Commodity Market model using 2019/20 marketing year crop data and 2020 calendar year livestock and biofuel data to project China's agricultural imports under six plausible policy scenarios focusing on ethanol, corn, and pork from 2021 to 2030. Our baseline projection reflects China's current policy of relaxing the tariff rate quota (TRQ) for corn and imposing ethanol tariff without any ethanol/gasoline blend mandate. Baseline projections show China's ethanol imports grow from 100 million liters in 2020 to 1.21 billion liters in 2030; however, they also show that China's corn and pork imports remain at high levels and peak in the 2022/23 marketing year. Compared with the baseline, adopting the ethanol mandate increases China's corn and pork imports, and resuming the corn TRQ increases China's ethanol and pork imports. Both the ethanol mandate and corn import restrictions shift US and global exports from corn to ethanol and pork products. These projections can serve as benchmark estimates of China's imports of major agricultural commodities in the next decade. [EconLit citations: Q17, Q18, Q11].

# A general equilibrium assessment of COVID-19's labor productivity impacts on china's regional economies

Xi He, Edward J. Balistreri, Gyu Hyun Kim  & Wendong Zhang 

*Journal of Productivity Analysis* (2022) | [Cite this article](#)

371 Accesses | [Metrics](#)

## Abstract

This study introduces a database for analyzing COVID-19's impacts on China's regional economies. This database contains various sectoral and regional economic outcomes at the weekly and monthly level. In the context of a general equilibrium trade model, we first formulate a mathematical representation of the Chinese regional economy and calibrate the model with China's multi-regional input-output table. We then utilize the monthly provincial and sectoral value-added and national trade series to estimate COVID-19's province-by-month labor-productivity impacts from February 2020 to September 2020. As a year-on-year comparison, relative to February 2019 levels, we find an average 39.5% decrease in labor productivity (equivalent to around 305 million jobs) and an average 25.9% decrease in welfare. Labor productivity and welfare quickly returned to the recent high-growth trends for China in the latter half of 2020. By September 2020, relative to September 2019, average labor productivity increased by 12.2% (equivalent to around 94 million jobs) and average welfare increased by 8.2%.

## What Have We Learned from China's Past Trade Retaliation Strategies?

Minghao Li, Wendong Zhang, and Chad Hart

JEL Classification: Q17, F10

Keywords: Agricultural Commodities, China, Tariff, Trade Retaliation

Citation: Li, M., W. Zhang, and C. Hart. 2018. "What Have We Learned from China's Past Trade Retaliation Strategies?" *Choices*. Quarter 2. Available online: <http://www.choicesmagazine.org/choices-magazine/submitted-articles/what-have-we-learned-from-chinas-past-trade-retaliation-strategies>

This article sheds light on some of China's agricultural trade retaliation principles by analyzing previous cases. China's responses follow three principles: (1) responding proportionally with restraint, (2) targeting substitutable products when possible, and (3) inflicting economic and political costs. With a more concrete understanding of China's motives and potential actions, U.S. policy makers and stakeholders can better evaluate the potential consequences of applying trade measures on China. Furthermore, as the trade dispute continues, any deviation from these principles on China's part may serve as a signal of the Chinese government's intention to escalate or deescalate the situation.

### Abstract

Small sample size often limits forecasting tasks such as the prediction of production, yield, and consumption of agricultural products. Machine learning offers an appealing alternative to traditional forecasting methods. In particular, support vector regression has superior forecasting performance in small sample applications. In this article, we introduce support vector regression via an application to China's hog market. Since 2014, China's hog inventory data has experienced an abnormal decline that contradicts price and consumption trends. We use support vector regression to predict the true inventory based on the price-inventory relationship before 2014. We show that, in this application with a small sample size, support vector regression outperforms neural networks, random forest, and linear regression. Predicted hog inventory decreased by 3.9% from November 2013 to September 2017, instead of the 25.4% decrease in the reported data.

### Abstract

Coal-fired power plants are among the biggest air polluters both in China and globally. In 2013, China launched a pilot project to switch its power plants from coal to natural gas to curb coal-fired plants' detrimental effects on air quality. Debates about this policy mainly invoke the costs, but no study examines whether the change led to cleaner air and associated economic benefits. This article provides the first causal estimate of the capitalization effect of coal-to-gas conversion on housing prices. We estimate a triple difference model using housing transaction data from 2011 to 2015 and administrative data on all power plants in Beijing. Our results, although marginally significant, show that coal-to-gas conversion leads to a positive price premium of 11% for nearby properties. We provide suggestive evidence that our findings of positive price premiums are likely attributable to the reduction in air pollutants following the coal-to-gas switch, including a 4.9% reduction in particulate matter and 5.2% decrease in SO<sub>2</sub>.

### Highlights

- The African Swine Fever (ASF) outbreaks in China since 2018 have wiped out more than 100 million pigs, representing one-fifth of the global hog inventory.
- Event studies are conducted to quantify the financial impacts of outbreaks on Chinese and global hog companies.
- Results show significant and positive abnormal stock returns for hog companies following ASF outbreaks.
- The positive and increasing stock returns are driven by the expected deteriorated supply shortages, especially since the 2019 Chinese New Year.
- Our results suggest opportunities for consolidation, expansion, and upgrades of China's meat industry, and its global competitiveness.

## Extension Education

# Nurturing International Graduate Students for a More Diversified and Inclusive Extension Workforce

Yangxuan Liu<sup>a</sup> and Wendong Zhang<sup>b,c</sup>

*University of Georgia<sup>a</sup>, Cornell University<sup>b</sup>, Iowa State University<sup>c</sup>*

JEL Codes: A23, Q16, Q18

Keywords: Economic education, Extension, diversity, graduate education, international graduate student, land-grant university

**Abstract:** The United States exports over 20 percent of its agricultural products; thus, agricultural trade and understanding global markets and partner countries' agricultural policies is increasingly important to its continued success. International graduate students represent a significant portion of agricultural economics students at many land-grant universities; however, many international graduate students do not receive exposure to Extension. We argue this creates an untapped resource to integrate graduate education and Extension services; thus, Extension misses opportunities to recruit top talent to serve the agricultural industry, and international graduate students have less job market success. Leveraging a survey of department heads and Extension economists in agricultural economics departments, our research documents the status of international Extension agricultural economists, identifies hidden and perceived barriers for international graduate students pursuing academic Extension careers, and provides insights into appropriate education and training programs in university graduate curricula to increase international graduate students' awareness of and interest in Extension.

States. Figure 2 illustrates US exports of four agricultural categories—bulk (e.g., corn, soybeans, wheat), intermediate (e.g., soybean meal and soybean oil), consumer-oriented (e.g., pork and beef products), and agriculture-related products (e.g., seafood and forestry products)—to high-income, upper-middle-income, lower-middle-income, and low-income countries from 1990 to 2020.
